Kioloa Campus visitor safety guide

ANU High Pressure Workshop

Welcome to Kioloa. Help keep everyone safe by following these precautions. First off, no need to panic, a little bit of common sense goes a long way.

Emergency number: 000

Before exploring

Complete the Kioloa visitor induction before arrival, then read the site guidelines and sign in. Keep to the campus avenues and cleared paths. ANU requires a completed risk assessment before entering its paddocks or bushland.

Snakes and spiders

- **Watch where you step.** Wear enclosed shoes outdoors and use a torch after dark. Avoid tall grass and **keep hands out of holes**, woodpiles and places you cannot see.
- **If you see a snake,** stop, give it space and slowly back away when safe. Let it move on. Never approach, touch, catch or kill it.
- **Check before use.** Inspect shoes, clothing and bedding, especially if left outdoors or on the floor. Look before reaching under outdoor furniture. Do not handle spiders.

Kangaroos and other wildlife

Watch from a distance. Never feed or touch wildlife, crowd animals for photographs, or approach their young. Give animals room to move away. Check for swooping birds (magpies & kookaburras) and dropbears* in gum trees -*their favourite habitat.* Don't pet possums as they bite, and don't wrestle with monitor lizards! Don't touch jellyfish- even dead ones on the beach.

Ticks and mosquitoes

Cover arms and legs and use DEET or picaridin repellent. Apply sunscreen before repellent. Check your skin and clothing for ticks and leeches after time in the bush.

The beach and ocean

- **Read the campus water-safety notices.** Check current conditions and local advice. Rip currents can carry even strong swimmers away from shore. Never swim alone, at night or after drinking alcohol. Look for fins, as there can be sharks (or dolphins).
- **If caught in a rip,** stay calm, float to conserve energy, raise an arm and call for help. Do not fight the current. If someone is in trouble, call 000 and alert a lifeguard.

Sun and changing weather

Despite the fact that the above information seems highly concerning, **the most dangerous hazard in Australia is the sun**[1], due to the clean air! Use broad-spectrum, water-resistant SPF 50+ sunscreen 20 minutes before going outside. Reapply every two hours and after swimming, sweating or towelling. Add a broad-brimmed hat, sunglasses, covering clothing and shade. Carry drinking water and a warm or waterproof layer.
UV indices frequently exceed the extreme threshold in the summer months.

Bushfire and emergencies

Know the assembly point and follow the site warden's directions. Observe fire restrictions and campus rules. Tell the organiser before leaving the group and when you return.

Emergency actions and contacts

Call 000 for an emergency

For a medical emergency, ask for an ambulance. Give this address and your exact building or location:

ANU Kioloa Coastal Campus
496 Murramarang Road, Kioloa NSW 2539

Alert the workshop organiser or campus staff and send someone to guide responders. Mobile coverage can be patchy.

Unresponsive and not breathing normally: Resuscitation takes priority over bandaging.

Suspected snake or funnel web spider bite

Treat a bite from an unidentified large black spider as a possible funnel-web bite.

1. Call 000 immediately. Do not wait for symptoms to appear.

2. Lie the person down and keep them still. Do not let them walk; bring help to them.

3. For a limb bite, apply pressure immobilisation. Use a broad, firm bandage over the bite and along the whole limb, then splint the limb to prevent movement. The bandage must not cut off circulation. Follow the emergency operator's instructions.

4. Leave bandages and splints in place until hospital staff remove them. Keep the whole person still while waiting for the ambulance.

Do not wash, cut or suck the bite, apply a tourniquet, or try to catch the animal.

Redback spider bite

Wash the area and apply a cold pack wrapped in cloth for about 15 minutes. **Do not apply a pressure bandage.** Call the Poisons Information Centre on **13 11 26** for advice. Seek medical care for severe pain or illness; call 000 for collapse or breathing difficulty.

Attached ticks

Do not squeeze or pull out an attached tick. Ask the first aider or seek medical advice about safe removal. If you have a known tick allergy, seek urgent medical help without disturbing it.

A reminder, common sense goes a long way. The top 9 most deadly animals in Australia list is actually quite surprising to many people. Total fatalities per animal over the last 10 years:

1. Horses: 77
2. Cows: 33
3. Dogs: 27
4. Kangaroos: 18
5. Bees and wasps: 16
6. Sharks: 16
7. Snakes: 14
8. Crocodiles: 9
9. Emus: 5

Unranked: Spiders: 0

Snakes and spiders photo guide

Regional examples- these are examples only!

BEWARE of these!

Eastern brown snake

Pseudonaja textilis

Venomous. Colour can range from pale tan to very dark brown; young snakes may be banded. While it looks most unassuming, it is actually the second most venomous snake in the world and relatively common.

Red-bellied black snake

Pseudechis porphyriacus

Venomous. Often found near water or damp areas. The red underside may be hidden from view.

Funnel web spider

Atrax sutherlandi

A species recorded in Kioloa State Forest. This is a male museum specimen.

Female redback spider

Latrodectus hasselti

Often shelters in dry, protected places. Males and young spiders can look different from this adult female.

Friends!

Huntsman spider

Shelob Heteropoda maxima

Non-venomous. Can range from large to very large. It is a common household pet in Australia, helpful for keeping cockroaches or similar pests out of the house.

Blue-tongued lizard (not the big one on the right!)

Tiliqua scincoides

Their head can look like that of a big snake.

Water Dragon

Intellagama lesueurii

Diamond python

Morelia spilota spilota

Non-venomous. Popular pet.
